

ACTIONS

.!	Implement	create, build, add
?.	Explain	what is, how, why
@.	Review	check, audit, look at
#.	Fix	debug, investigate, repair
~.	Refactor	simplify, optimize, clean
^.	Plan	design, approach, strategy
&.	Analyze	explore, research, compare
-.	Remove	delete, drop, clean up
=.	Update	change, modify, rename
\$.	Git	commit, push, branch

MODIFIERS

.a	All	entire scope
.q	Quick	brief, 2-3 sentences
.d	Deep	thorough, detailed
.s	Self	autonomous, no questions
.o	Only	strict scope, nothing else

CHAINS

> then *sequential* + and *parallel*

.s = do it yourself, no questions
.o = strict scope, don't touch anything else
.q = max 2-3 sentences response
Mix with natural language:
.! auth, but JWT only — no OAuth

SIMPLE

```
.! auth api
?.q redis cache
.# 401 login
.@.a tests
.$.s
```

PIPELINES

```
.^ > .! search
plan then implement
```

```
.@ > .#.s api
review then auto-fix
```

```
.&.d > .#.s.o > $.s api.php
deep analyze → auto-fix only this →
auto-commit
```

```
.! tests + .! docs
create both in parallel
```

```
!.s > $.s migration
full auto: implement → commit
```

WORDPRESS / PHP

<code>.! acf block hero</code>	Create ACF block for hero section
<code>.# cf7 form 500</code>	Fix 500 error on Contact Form 7
<code>.@.a theme php</code>	Review all PHP in theme
<code>.~ wp_query taxonomy</code>	Refactor taxonomy queries
<code>.&.d redis cache hit rate</code>	Deep analysis of Redis cache performance
<code>!.s yoast schema breadcrumbs</code>	Auto-implement breadcrumb schema

LARAVEL

<code>.! job process-import</code>	Create a queue job for import
<code>.^ > .!.s api auth jwt</code>	Plan then auto-implement JWT auth
<code>.# horizon failed jobs</code>	Debug failed Horizon jobs
<code>.@ > .~ eloquent n+1</code>	Review then refactor N+1 queries

DOCKER / DEVOPS

<code>.# container exit code 137</code>	Debug OOM-killed container
<code>.! docker-compose traefik</code>	Create compose with Traefik
<code>.?.q k3s vs docker swarm</code>	Quick comparison

PIPELINES (MULTI-STEP)

<code>.&.d > .#.s.o > .\$.s api.php</code>	Analyze deeply → auto-fix only this → auto-commit
<code>.@.a > .~.s > .\$.s controllers</code>	Review all → auto-refactor → auto-commit
<code>.! tests + .! docs</code>	Implement tests AND docs in parallel
<code>.^d > .!.s migration strategy</code>	Deep plan → auto-implement migration

MIXED WITH NATURAL LANGUAGE

<code>.! auth, but JWT only – no OAuth</code>	Constraint after comma
<code>.# login 500 – Safari only</code>	Extra context after dash
<code>.^ search, 50k posts, need <100ms</code>	Requirements inline
<code>.~ api – keep backward compat</code>	Constraint for refactor

GIT SHORTCUTS

<code>.\$</code>	Commit (you choose message)
<code>\$.s</code>	Auto-commit (Claude picks message)
<code>!.s > \$.s feature</code>	Full auto: implement → commit

QUICK ANSWERS

<code>.? spec.md</code>	Explain this file
<code>.?.q SOLID</code>	Quick explanation (2-3 sentences)
<code>.?.d event sourcing vs CRUD</code>	Deep comparison with trade-offs
